

Use the slip vector sv as a pole to plot the nodal plane PN_2 . This nodal plane PN_2 goes through the pole p_1 . The intersection between the plane PN_1 and PN_2 is the line n .

Use n as a pole of an virtual plan (in dotted red) here, go through sv and p_1 . Plot the maximum compressive stress p corresponding from the point at 45° of sv and 45° of p_1 ; and plot the minimum compressive stress t locating at 90° of p .

Focal mechanism for earthquake with :

Strike = 45°; Dip = 60°; Slip = -30°

Principal stresses :

t : σ_1

n : σ_2

p : σ_3
